(54) Title: USE OF 7 ALPHA-SUBSTITUTED STEROIDS TO TREAT NEUROPSYCHIATRIC, IMMUNE OR ENDOCRINE DISORDERS

(57) Abstract

Use is provided for a 7α-hydroxy or 7-oxo substituted 3β-hydroxy-steroid possessing the carbon skeleton of cholesterol, androsterone, pregnenolone or estradiol, or an analogue thereof substituted independently at one or both of the 7- and 3-positions with an ester or ether group, in the manufacture of a pharmaceutical composition for the therapy of neuropsychiatric, immune and/or endocrine disorders or for inducing cognitive enhancement. Uses for Cyp7b enzymes in producing such steroids is also provided together with various novel steroids and test kits and methods for diagnosing the disorders.

USE OF 7 ALPHA-SUBSTITUTED STEROIDS TO TREAT NEUROPSYCHIATRIC, IMMUNE OR ENDOCRINE DISORDERS

The present invention relates to novel uses for 7α-hydroxy-substituted steroids, to a process for preparing such steroids and to novel steroids so produced.

In particular the invention relates to the use of cytochromes of the cytochrome P450 family designated Cyp7b to effect 7α-hydroxylation of certain 3β-OH steroids so as to produce a 7α-hydroxy-substituted steroids. Certain of the 7α-hydroxy-substituted steroids so produced, as well the corresponding 7-oxo derivatives, are novel and form further aspects of the invention. The invention also relates to uses of these steroids, to uses of Cyp7b enzymes and to uses of novel macromolecular species, eg. antibodies and DNAs, which are biologically related to the Cyp7b enzymes.

Cytochromes P450 are a diverse group of heme-containing mono-oxygenases (termed CYP's; see Nelson *et al.*, DNA Cell Biol. (1993) 12, 1-51) that catalyse a variety of oxidative conversions, notably of steroids but also of fatty acids and xenobiotics. While CYP's are most abundantly expressed in the testis, ovary, placenta, adrenal and liver, it is becoming clear that the brain is a further site of CYP expression. Several CYP activities or mRNA's have been reported in the nervous system but these are predominantly of types metabolizing fatty acids and xenobiotics (subclasses CYP2C, 2D, 2E and 4). However, primary rat brain-derived glial cells have the capacity to synthesize pregnenolone and progesterone *in vitro*. Mellon and Deschepper, Brain Res.. (1993), 629, 283-292(9) provided molecular evidence for the presence, in brain, of key steroidogenic enzymes CYP11A1 (scc) and CYP11B1 (11ß) but failed to detect CYP17 (c17) or CYP11B2 (AS). Although CYP21A1 (c21) activity is reported to be present in brain, authentic CYP21A1 transcripts were not detected in this tissue.

Interest in steroid metabolism in brain has been fuelled by the finding that adrenal- and brain-derived steroids (neurosteroids) can modulate cognitive function and synaptic plasticity. For instance, pregnenolone and steroids derived from it are reported to have memory enhancing effects in mice. However, the full spectrum of steroid metabolizing CYP's in brain and the biological roles of their metabolites *in vivo* has not been established.

Many aspects of brain function are modulated by steroids. Intracellular receptors for glucocorticoids (cortisol, corticosterone) are particularly abundantly expressed in the

hippocampus (1), a brain region that plays a key role in specific aspects of memory formation, and which is an early and prominent target for dysfunction and damage in Alzheimer's disease (AD). While glucocorticoids regulate learning and memory, mood and neuroendocrine control, chronic glucocorticoid excess compromises neuronal activity, synaptic plasticity and eventually survival, particularly in the hippocampus. These findings prompted the suggestion that glucocorticoid-mediated neurotoxicity might underpin some age-related brain disorders, including AD, in which plasma cortisol levels are markedly elevated (2).

Conversely, dehydroepiandrosterone (DHEA), the most abundant steroid product of the human adrenal cortex, has been proposed to protect against disorders of the aging brain (3). Plasma levels of DHEA often show a striking age-associated decline which correlates with loss of cognitive function (4). In rodents, injection of DHEA or its sulfate into limbic structures improves post-training memory and enhances synaptic plasticity (5). DHEA and glucocorticoids thereby appear to exert inverse effects upon memory function and synaptic plasticity, and DHEA has been advocated as an endogenous 'anti-glucocorticoid'. However, despite considerable circumstantial evidence to support this contention, there is no evidence for a direct interaction between DHEA and glucocorticoid signalling pathways in neurons.

Neurosteroidogenesis has been reported in isolated rat retina (8) and brain (9). In addition to the production of pregnenolone and DHEA from cholesterol, a variety of novel steroids are made in brain extracts or cultured brain cells, including 20α-dehydropregnenolone, 7α-hydroxy derivatives of pregnenolone and DHEA, progesterone, and both 3α- and 3β-hydroxy-5α-pregnan-20-one (reviewed in Ref. 7). Androgens are also modified, particularly through the action of aromatase and a 5α-reductase (reviewed in Ref. 10). However, the specific enzymes responsible for these and other transformations in the central nervous system have not been well characterized.

As referred to above, several Cyps are present in the central nervous system (11-22). Activities or mRNAs corresponding to key steroidogenic enzymes (23-25), in addition to Cyp19 (aromatase) have been detected. Furthermore, mRNAs encoding the non-Cyp hydroxysteroid dehydrogenases (HSD) 3α-HSD, 3β-HSD and 11β-HSD have been reported in the central nervous system (25, 27-29).

To investigate regulation of brain function, studies reported in copending International Patent Application No PCT/GB95/02465, published as WO 96/12810, and in Stapleton *et al* (J. Biol. Chem. 270, 29739 - 1995, December, 15 1995), focused on the hippocampus, a brain region important in learning and memory. A copy of the specification of International Patent Application No PCT/GB95/02465 has been filed with the priority documents filed in respect of this specification.

That copending application, PCT/GB95/02465, describes and claims novel cytochrome P450 proteins designated Hct-1. These Hct-1 proteins have now been named as Cyp7b by the Committee on Standardized Cytochrome P450 Nomenclature and the name Cyp7b will be used in this application.

The Cyp7b enzyme shares 39% sequence identity to hepatic cholesterol 7α-hydroxylase (Cyp7a) and lesser but significant homology with other steroidogenic Cyps. The postulated steroidogenic domain (30,31), found in many of these enzymes, is present in both Cyp7a and Cyp7b. Cyp7b mRNA is predominantly expressed in rodent brain, particularly in the hippocampus, unlike Cyp7a, which is liver-specific (31-33 and EP0648840 A2).

The present inventors have now investigated the substrate specificity of Cyp7b and found that Cyp7b catalyses the introduction of a hydroxyl group at the 7α position in steroid substrates, particularly 3β-hydroxy steroids. Cytochromes Cyp7b are thus steroid hydroxylase enzymes having 7α-specificity. The ability to produce 7α-hydroxylated steroids is of major commercial importance, because such steroids are of particular use in the manufacture of pharmaceuticals (either as drugs *per se* or as intermediates), and in the manufacture of test kits and assays for pathological conditions associated with the presence of abnormal levels of endogenous enzyme, substrate or product.

The abbreviation "DHEA" will be used herein to designate dehydroepiandrosterone, thus 7α-hydroxy-DHEA designates 7α-hydroxydehydroepi-androsterone

The present inventors have identified substrate/product pairs associated with Cyp7b, particularly DHEA/7α-hydroxy-DHEA (7-HD), pregnenolone/7α-hydroxy-pregnenolone (7-HP) and β-estradiol/7α-hydroxy-β-estradiol (7-HE). They have also determined that DHEA concentration in brain tissue declines with age, whereas the concentrations of other brain steroids do not, and determined that the ageing process may be associated with

deficits in certain steroids and also with deficits in the concentration of Cyp7b itself. It is also believed that one of the products produced by Cyp7b mediated reactions. namely 7α-hydroxy dehydroepiandrosterone, plays an important role in the operation of the immune system. Because 7α-hydroxy-DHEA is believed to be made substantially only in the brain, the inventors hypothesize that senescence may be due to a deficit in brain-produced 7α-hydroxy-DHEA as well as in other steroids found in the brain such as DHEA, pregnenolone and 7α-hydroxy-pregnenolone.

The present inventors have now further determined that one of the specific properties of the 7α-hydroxy-substituted steroids, and potentially their 7-oxo substituted steroid derivatives, provided by the present invention is that of glucocorticoid and/or mineralocorticoid antagonism, whether at receptor level or otherwise. This is particularly demonstrated by the Example 5 below with respect to 7α-hydroxy-DHEA but is more generally applicable. Thus this activity not only gives further uses for the novel steroids of the invention but provides first and second medical uses for known 7α-hydroxy or 7-oxo steroids made available by the present process as glucocorticoid and/or mineralocorticoid antagonists and preferably in antagonism specific to neuronal tissue such as in the CNS.

Thus, having regard to this activity and their involvement in endogenous metabolic pathways, particularly in the brain, the 7α-hydroxy substituted 3β-hydroxy-steroids provided by use of the Cyp7b enzyme activity, including novel compounds provided by the invention, and their 7-oxo derivatives, have utility in the therapy of neuropsychiatric, immune and endocrine disorders, particularly but not exclusively steroid associated disorders.

Use of these 7α-hydroxy or 7-oxo substituted 3β-hydroxy-steroids, preferably possessing the carbon skeleton of cholesterol, androsterone, pregnenolone or estradiol, or derivatives thereof substituted independently at one or both of the 7- and 3- positions with an ester or ether group, in treating these disorders and for manufacturing medicaments for such treatment is provided in a first aspect of the present invention. Particularly preferred derivatives are those wherein one or both of the ester and or ether group is metabolisable *in vivo* to produce the corresponding hydroxy compound.

Preferred derivatives include those wherein the steroid has a 3β-substituent-OR_1 and/or a 7α-substituent -OR_2 where -OR_1 and -OR_2 each independently represents a free

hydroxy, ester or ether group,

wherein each of R_1 and R_2 are independently selected from the group consisting of hydrogen, substituted or unsubstituted C_{1-6} alkyl groups, groups R_5CO-, wherein R_5 may be selected from substituted or unsubstituted C_{1-6} alkyl groups, and groups of the formula $-OP(OH)_3$, wherein any substituents are selected from OH, halogen (F, Cl, Br, I) amino, C_{1-6} alkylamino, C_{1-6} dialkylamino, COOH or $COOR_4$ wherein R_4 represents a C_{1-6} alkyl group; and wherein the compounds may be in free form or in the form of acid addition salts with pharmacologically acceptable anions.

The particular disorders for which this utility is provided include

(a) deficits of cognition in aging

(b) Alzheimer's disease

(c) deficits of immune system in aging

(d) deficits of immune function in HIV infection

(e) glucocorticoid or mineralocorticoid excess

(f) diabetes

(g) depression

(h) osteoporosis and hypercalcemia

(I) hyperglycemia and hyperlipodemia

(j) muscle atropy

(k) arteroscIerosis

(l) steroid diabetes

Further, these 7α-hydroxy steroids, their esters, ethers and 7-oxo derivatives may be used to induce cognitive enhancement in a normal individual.

Preferred steroids for such use have the carbon skeleton of androsterone, pregnenolone or estradiol and particularly preferred examples are 7α-hydroxy-DHEA and 7α-hydroxypregnenolone. Accordingly the present invention further provides the use of novel compounds of Formula Ia and Ib shown below in the applications indicated above.

Particularly preferred uses for the antagonistic properties of these 7-substituted steroids include treatment of disorders falling within category (e) above or where reversal of the effects of such corticoids, regardless of excess, is required.

A second aspect of the present invention provides pharmaceutical compositions implementing such use. The compositions in which the novel steroids and known steroids of the invention will be used will readily occur to those skilled in the art, generally comprising the steroid active in association with a pharmaceutically acceptable carrier or diluent, with formulations for example being suitable for inhalation or for gastrointestinal (eg. oral), parenteral, topical, transdermal or transmucosal administration.

As an alternative to administering the compounds of the invention *per se*, a third aspect of the invention provides the possibility of using the gene sequences of the Cyp7b genes in gene therapy in order to compensate for a deficiency in Cyp7b enzyme. In such therapies, constructs comprising Cyp7b coding sequences can be packaged in conventional delivery systems, such as andenoviruses, vaccinia viruses, herpes viruses and liposomes and administered via a route which results in preferential targeting of a selected tissue, especially the brain. The invention further provides the possibility of using the gene sequences of the Cyp7b genes in gene therapy in order to achieve the endogenous expression of Cyp7b sequences for other purposes, e.g. in order to promote immunogenic processes. Thus for example, a vector such as a suitably modified vaccinia virus (or variant thereof) may be co-administered with a vaccine formulation so that the expressed Cyp7b sequences augment the immunogenic properties of the vaccine.

It will be realised that in the event of Cyp7b related disorders other than those involving its depletion it may be desirable to use vectors containing antisense sequences to Cyp7b effective such as to inhibit Cyp7b expression.

Macromolecules related immunologically to Cyp7b enzymes form fourth and fifth aspects of the invention and in this regard antibodies, particularly monoclonal antibodies which are capable of selectively binding Cyp7b, have utility in the diagnosis of disorders (a) to (l) referred to above. Anti-Cyp7b antibodies (including monoclonal antibodies) as well as binding molecules comprising antibody fragments may be produced by known methods and used in test kits for assays for Cyp7b enzymes.

According to a sixth aspect of the invention, there is provided a process of producing a 7α-hydroxy-substituted steroid which comprises subjecting a corresponding steroid substrate having no hydroxyl substituent in the 7-position to hydroxylation in the presence of a Cyp7b steroid hydroxylase enzyme.

The Cyp7b steroid hydroxylase enzyme used in the process of the invention is preferably a Cyp7b enzyme described and claimed in the above-mentioned International Patent Application No PCT/GB95/02465 (and referred to therein as Hct-1). Such enzymes include (a) ones having the precise amino acid sequences described for mouse, rat and human Cyp7b, (b) homologous enzymes from other species and (c) enzymes having amino acid sequences which differ from the sequences of enzymes included in definitions (a) and (b), but in which the capacity to catalyse the introduction of a 7α-hydroxyl group is not eliminated.

The amino acid sequence of suitable Cyp7b steroid hydroxylase enzymes may be defined in terms of the DNA coding sequences disclosed in International Patent Application No PCT/GB95/02465. Thus the Cyp7b steroid hydroxylase enzyme may have a sequence encoded by DNA coding sequences of Cyp7b enzymes selected from

(a) Coding sequences of DNA molecules comprising the coding sequence for rat Cyp7b set forth in SEQ Id No: 1,

(b) Coding sequences of DNA molecules comprising the coding sequence for mouse Cyp7b set forth in SEQ Id No: 2,

(c) Cyp7b steroid hydroxylase-encoding DNA molecules capable of hybridizing with the DNA molecule defined in (a) or (b) under standard hybridization conditions defined as 2 x SSC at 65°C.

(d) Cyp7b steroid hydroxylase-encoding DNA molecules capable of hybridizing with the DNA molecule defined in (a), (b) or (c) under reduced stringency hybridization conditions defined as 6 x SSC at 55°C.

The sequences (a) and (b) above represent rat and mouse Hct-1 gene sequence. Homologous sequences from other vertebrate species, especially mammalian species (including man) fall within the class of DNA molecules represented by (c) or (d).

Thus for human Cyp7b, the steroid hydroxylase enzyme may comprise a sequence encoded by

(e) DNA coding sequences selected from the following:

(i) the sequence designated "exon 3" in SEQ Id No 3,

(ii) the sequence designated "exon 4" in SEQ Id No 3, and

(f) Cyp7b steroid hydroxylase-encoding DNA molecules capable of hybridizing with the DNA molecules defined in (e) under standard hybridization conditions defined as 2 x SSC at 65°C.

(g) Cyp7b steroid hydroxylase encoding DNA molecules capable of hybridizing with the DNA molecule defined in (e) or (f) under reduced stringency hybridization conditions defined as 6 x SSC at 55°C.

(h) Cyp7b steroid hydroxylase-encoding DNA molecules comprising contiguous pairs of sequences selected from

(i) the sequence designated "exon 3" in SEQ Id No 3,

(ii) the sequence designated "exon 4" in SEQ Id No 3, and

(i) Cyp7b steroid hydroxylase-encoding DNA molecules capable of hybridizing with the DNA molecules defined in (h) under standard hybridization conditions defined as 2 x SSC at 65°C.

(j) Cyp7b steroid hydroxylase-encoding DNA molecules capable of hybridizing with the DNA molecule defined in (h) or (i) under reduced stringency hybridization conditions defined as 6 x SSC at 55°C.

(k) Coding sequences of DNA molecules comprising a contiguous coding sequence consisting of the sequences "exon 3" and "exon 4" in SEQ Id No 3, and

(l) Cyp7b steroid hydroxylase-encoding DNA molecules capable of hybridizing with the DNA molecules defined in (k) under standard hybridization conditions defined as 2 x SSC at 65°C.

(m) Cyp7b steroid hydroxylase-encoding DNA molecules capable of hybridizing with the DNA molecule defined in (k) or (l) under reduced stringency hybridization conditions defined as 6 x SSC at 55°C.

It will be appreciated that the DNA sequences referred to may consist of or be derived from genomic DNA, but typically would consist of or be derived from cDNA. Such sequences could be obtained by probing an appropriate library (cDNA or genomic) using hybridisation probes based upon the sequences provided according to the invention of International patent application No PCT/GB95/02465, or they could be prepared by chemical synthesis or by ligation of sub-sequences.

In the above definitions, Cyp7b steroid hydroxylases have been defined in terms of DNA sequence information. The Cyp7b steroid hydroxylase enzyme used in accordance with the process of the invention may alternatively or additionally be defined by reference to amino acid sequence information, e.g. the amino acid sequences contained in SEQ ID NO. 4, SEQ ID NO. 5 or SEQ ID NO 6.

Thus the Cyp7b steroid hydroxylase enzyme used in accordance with the process of the invention may have sequences matching one of said sequences exactly, or alternatively, the enzymes used may have sequences which differ from the aforementioned sequences, provided that the capacity to catalyse the introduction of a 7α-hydroxyl group is not eliminated.

Thus, for example, mutant enzymes may be produced by known methods, for example site-directed mutagenesis or other PCR-based procedures, and the expression

products tested for their capacity to catalyse the introduction of a 7α-hydroxyl group in selected substrates in accordance with the procedures described herein.

Having regard to the degree of homology between the rat, mouse and human enzymes and known data relating to species divergence of hydroxylase enzymes, it is preferred that by comparison with the DNA sequences of SEQ ID NO. 1, SEQ ID NO. 2 and SEQ ID NO.3, the mutant enzymes should should be encoded by sequences having at least 50% homology, more preferably at least 60% homology and most prefereably at least 70% homology with said sequences over a length of 50 contiguous nucleotides.

Preferably the mutant enzymes are encoded by sequences having at least 60% homology with the entire coding sequence, more preferably at least 70%.

Alternatively, by comparison with the amino acid sequences of SEQ ID NO. 4, SEQ ID NO. 5 and SEQ ID NO.6, it is preferred that mutant enzymes should have at least 50% homology, more preferably at least 60% homology and most prefereably at least 70% homology with said sequences over a length of 30 contiguous amino acids. Preferably the mutant enzymes have at least 60% homology and more preferably 70% homology or more with the entire amino acid sequence in each case.

It is however preferred that such mutant enzymes do not differ too drastically from the aforementioned sequences and in this regard, where amino acid substitutions are made, that the substituted amino acids are preferably so-called "synonymous" or "conservative" substitutions, i.e. hydrophilic, hydrophobic, basic and acidic amino-acids should preferably be substituted by amino acids in the same class (see US 5380712).

More specifically, it is preferred that the mutant enzymes differ from the precise sequences of those described herein by not more than 20, preferably not more than 10 and most preferably not more than 5 amino acid substitutions, insertions or deletions.

The Cyp7b enzymes described herein may be used in toxicological and drug evaluation studies and such uses form further aspects of the invention. In a particularly preferred embodiment of this aspect of the invention, a cell line capable of expressing a Cyp7b enzyme is used as a basis of an assay for one or more Cyp7b substrates. Such cell lines have utility in toxicological and drug evaluation studies. Most preferably the cell line comprises a prokaryotic or eucaryotic cell line which has been transformed so as artificially to express a Cyp7b enzyme. Examples include bacteria, yeast and mammalian cells. Also

included are transgenic animals, at least one tissue of which (especially a non-brain tissue) expresses Cyp7b enzyme. Such transgenic animals may be produced by known methods for introducing foreign coding sequences into somatic or germ line cells.

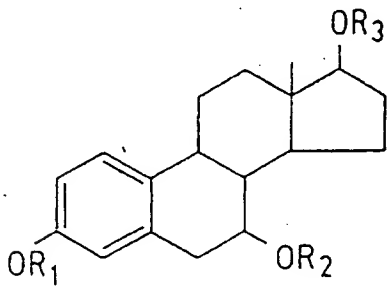
The substrates used in the method of the invention are characterised by possessing a 3β-hydroxyl group and further by preferably possessing the carbon skeleton of cholesterol, androsterone, pregnenolone or estradiol, with the proviso that where the substrate has the carbon skeleton of cholesterol, the substrate has a hydroxyl group in the 25, 26 or 27-position, preferably the 25-position.

Examples of such substrates include 25-hydroxycholesterol, dehydroepiandrosterone, pregnenolone and estradiol, in which case the steroids produced will be 7α-hydroxy-25-hydroxycholesterol, 7α-hydroxydehydroepiandrosterone, 7α-hydroxy pregnenolone and 7α-hydroxyestradiol (i.e. estra 1,3,5(10)-triene-3,7α,17β-triol) respectively.

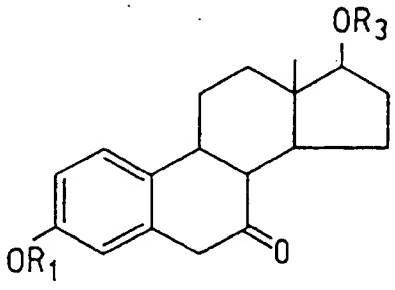
The 7α-hydroxylated steroid produced according to the invention may be oxidised by known enzymatic or non-enzymatic procedures to produce 7-oxo substituted steroids and this further process step forms a further aspect of the invention.

Certain 7α-hydroxy-substituted steroids produced according to the invention and certain corresponding 7-oxo derivatives are novel and provide a further aspect of the invention. Thus the present invention further provides novel 3β-hydroxy steroids characterised in that they have a 7α-hydroxy or 7-oxo substitutuent. Preferred novel steroids have the carbon skeleton of cholesterol, androsterone, pregnenolone or estradiol, with the provisio that where the skeleton is that of cholesterol, the 25, 26 or 27 position is hydroxylated, most preferably the 25 position.

Particular novel steroids are of the formula



Ia



Ib

wherein OR_1, OR_2 and OR_3 each independently represents a free hydroxy group, an ether group or an esterified hydroxy group.

In the case where OR_1, OR_2 and OR_3 each independently represents an ether group, each of R_1, R_2 and R_3 may be selected from substituted or unsubstituted C_{1-6} alkyl groups, any such substituents being selected from OH, halogen (F, Cl, Br, I) amino, C_{1-6} alkylamino, C_{1-6} dialkylamino, COOH or $COOR_4$ wherein R_4 represents a C_{1-6} alkyl group which may be unsubstituted or substituted by one of the substituents referred to above.

In the case where OR_1, OR_2 and OR_3 each independently represents an esterified hydroxy group, each of R_1, R_2 and R_3 may have the formula R_5CO-, wherein R_5 may be selected from substituted or unsubstituted C_{1-6} alkyl groups, any such substituents being selected from OH, halogen (F, Cl, Br, I) amino, C_{1-6} alkylamino, C_{1-6} dialkylamino, COOH or $COOR_4$ wherein R_4 represents a C_{1-6} alkyl group; and groups of the formula $-OP(OH)_3$. Where compounds of Formula Ia or Ib include substituents such as carboxyl groups, phospate groups, or substituted or unsubstituted amino groups, the compounds may be in free form or in the form of acid addition salts with pharmacologically acceptable anions (such as, for example, phosphate or halide ions) or cations (such as, for example, alkaline metal cations). Thus, where OR_1, OR_2 or OR_3 represents hemesuccinate $HOOC(CH_2)_2CO$, the resulting hemesuccinate may be in the form of, for example, an Na or K salt.

It will be realised that the present invention provides for 7α-hydroxylated and 7-oxo steroids as described above but which are further substituted at other positions directly on the steroid skeleton.

7α-Hydroxyestradiol and 7-oxoestradiol are specific examples of compounds of Formula Ia and Ib.

The invention will now be described in more detail with particular reference to the following Figures and Examples.

Description of Figures

Figure 1 illustrates an autoradiogram of a TLC plate used in an experiment to assess the ability of various cell extracts to hydroxylate DHEA.

Figure 2 depicts the ability of various tissues to release radioactivity from 7-^{3}H-pregnenolone.

Figure 3 illustrates the principal steroid interconversions mediated by Cyp7b.

Figure 4 is a histogram plotting fold induction of luciferase expression with concentration of various steroids as described in Example 5.

Figure 5 illustrates the attenuation of Cyp7b gene expression in Alzheimer's as described in Example 5.

Figure 6 shows mass spectrometer plots of 7α-hydroxy-DHEA produced by the present process and a reference sample thereof.

EXAMPLE 1 - Identification of substrate specificity of Mu Cyp7b

A. Preparation of vaccinia expression construct

To identify the reaction catalysed by Cyp7b a cDNA encoding the mouse enzyme, reported by Lathe, Rose and Stapleton (PCT/GB95/02465) and by Stapleton et al. (J. Biol. Chem. 270, 29739-1995, December 15 1995), was modified to introduce a translation initiation consensus sequence at the 5' end of the Cyp7b open reading frame as described therein. The modified cDNA was introduced into the genome of vaccinia virus by recombinational exchange according to standard procedures (see, for instance, Gonzalez et al., Meth. Enzymol. 206, 85-92, 1991 and references therein) as described in Lathe et al.

B. Production of Cyp7b enzyme extracts.

Hela cells were grown to semi confluence (10^{6} cells per 5 cm dish; 5 ml medium) and infected with recombinant (VV-Cyp7b) and control (VV Copenhagen strain) vaccinia viruses at 0.1 pfu per cell; 16 hours later infected cells were washed and taken up into W (Waxman) buffer (0.1 M KP04, 1 mM EDTA, 20% glycerol pH 7.5; 500 µl per plate) and recentrifuged (5 min., 1000 rpm).

For whole cell extracts cells were resuspended into 1/100 volume (50 µl per plate) of W buffer and stored frozen at -70°C. For microsome preparation (Waxman, Biochem. J. 260, 81-85, 1989) cells were resuspended in 1/10 original volume of W buffer (500 µl per plate); sonicated 6 x 5 seconds on ice, and unbroken cells were removed by centrifugation (10 min., 4°C, 3000 rpm).

The microsomal fraction was prepared from the supernatant by centrifugation

(100.000 g, 45 min., 4°C. Beckman SW50.1 rotor) and resuspended using a Potter homogeniser in 1/50 original volume of W buffer (100 µl per plate) before storage at -70°C.

Control extracts were prepared from liver and brain from male rat by homogenising fresh tissue in W buffer (2.5 ml/g), clarifying briefly by centrifugation (4000 rpm, 5 min, 4°C); the supernatant was stored at -70°C.

C. Substrate identification by thin-layer chromatography.

^{14}C or ^{3}H-labelled steroids were purchased from DuPont-NEN (^{14}C-labelled molecules: specific activities 45-60 mCi/mmol.; ^{3}H: specific activities 70-100 mCi/mmol). 1 nMol aliquots of labelled substrate were dried down, microsomes or cell and tissue extracts were added (25 to 50 µl), and diluted to a volume of 175 µl with W buffer.

Reaction was started by the addition of 25 µl of 8 mM NADPH. After incubation at 37°C for 15 minutes the reaction was shaken with 500 µl of ethyl acetate (BDH). The organic phase was removed, dried down, and suspended into 10 µl ethyl acetate. Aliquots (5 x 2 µl) were applied to thin layer chromatography (TLC) sheets (Merck) and developed in ethyl acetate/n-hexane/acetic acid 16:8:1 (solvent system N of Waxman, Meth. Enzymol. 206, 462-476, 1991). After drying, chromatograms ^{14}C were visualised by exposure to X-ray film. ^{3}H-labelled chromatograms were treated with EN^{3}HANCETM (DuPont-NEN) spray prior to exposure.

D. Results

Figure 1 is an autoradiogram of a TLC plate run in solvent system N; substrate was ^{3}H-DHEA and samples were extracted with ethyl acetate and dried prior to application to the TLC plate (origin at bottom of figure). Extracts were 1, Microsomes from Hela cells infected with control vaccinia virus (negative control); 2, Microsomes from Hela cells infected with VVCyp7b; 3, Duplicate preparation of microsomes from Hela cells infected with VVCyp7b; 4, Rat brain homogenate.

As can be seen from Figure 1, microsomes from cells infected with recombinant vaccinia expressing Cyp7b converted ^{14}C-dehydroepiandrosterone (DHEA) to a lower mobility form most consistent with hydroxylation. Brain extracts yielded a product of indistinguishable mobility, consistent with our earlier demonstration that Cyp7b is

expressed in brain. From the relative mobility of the product we surmised that Cyp7b could be hydroxylating DHEA at the 7 position. Progesterone, corticosterone, cortisol and testosterone were at best inefficiently metabolised, if at all. However, pregnenolone and estradiol were both converted by the enzymes, as was 25-hydroxy cholesterol. All these substrates are distinguished by a 3β hydroxy group.

EXAMPLE 2 - Identification of the position of the modification by ^{3}H-release.

To Identify the position of the modification, ^{3}H-pregnenolone (NEN) was employed in which the ^{3}H substitution was predominantly at the 7 position on the steroid backbone. Microsomal extracts were incubated with ^{3}H-pregnenolone under the same conditions as used earlier. Following reaction, labelled steroids were extracted with ethyl acetate (2 x 1 ml), and discarded; release of ^{3}H into the aqueous phase was monitored by liquid scintillation counting.

Referring to Figure 2, 7-^{3}H-pregnenolone was incubated with extracts and assayed for release of radioactivity into the aqueous phase following extraction with ethyl acetate. Extracts were 1, Microsomes from Hela cells infected with control vaccinia virus (negative control); 2, Microsomes from Hela cells infected with VVCyp7b; 3, Duplicate preparation of microsomes from Hela cells infected with VVCyp7b; 4, Rat brain homogenate; 5, Rat liver homogenate.

As seen in Figure 2 microsomes from cells infected with recombinant vaccinia expressing Cyp7b efficiently released ^{3}H into the aqueous phase. Brain also performed this reaction but not liver. Release of ^{3}H from the 7 position of pregnenolone demonstrates that Cyp7b hydroxylates pregnenolone at the 7-position to generate 7-hydroxy pregnenolone (7HP); it may be concluded that Cyp7b also hydroxylates DHEA (to generate 7-hydroxy DHEA [7HD]) and estradiol to generate 7-hydroxy estradiol [7HE].

EXAMPLE 3 - Stereochemistry of the Cyp7b hydroxylation.

Steroids hydroxylated at a variety of positions (egs. 2, 6, 7, 15, 16) differ in their mobility on TLC depending on whether the modification is in the α- or the β-position (Waxman, Meth. Enzymol. 206, 462-476, 1991). Purified 7α-hydroxy DHEA was obtained (kind gift of Dr. H.A. Lardy, Enzyme Institute, University of Wisconsin), mixed with the product of Cyp7b action on DHEA, and subjected to TLC. The product

comigrated with 7α- hydroxy-DHEA, demonstrating that Cyp7b is a 7α hydroxylase.

EXAMPLE 4 - Activity of enzyme in 7α-hydroxylation of pregnenolone and DHEA

To examine the catalytic activity of the enzyme Cyp7b CDNAs were expressed in mammalian cell lines. Cell extracts showed substantial NADPH-dependent conversion of DHEA (Km 13.3μM; Vmax 288pmol/min/mg) and pregnenolone (Km 3.6μM; Vmax 34 pmol/min/mg) to slower migrating forms on thin layer chromatography. Products of identical mobility were generated by rat brain extracts . The expressed enzyme was less active against 25-hydroxycholesterol, 17β-estradiol and 5α-androstane-3β, 17β-diol, with low to undetectable activity against progesterone, corticosterone and testosterone. When [^{3}H-7α] pregnenolone was incubated with Cyp7b extracts the extent of release of radioactivity into the medium suggested that hydroxylation was preferentially at the 7α-position. In gas chromatography and mass spectrometry of the modified steroid arising from incubation of DHEA with Cyp7b extracts, the retention time and fragmentation patterns were identical to those obtained with authentic 7α-hydroxy DHEA (7HD); the reaction product also co-migrating with 7HD on TLC.

Mass spectrometry: A 10x scaled up reaction was employed using 95% unlabelled DHEA (Sigma) and 5% [14C]-DHEA (final specific activity 2.25-3mCi/mmol) and reaction time was extended to 1 hour. Product was purified by TLC, excised and extracted with ethyl acetate before drying down. The dried residue and authentic 7HD (50mg) were converted to their methoxime -trimethylsilyl (MO-TMS) derivatives. Analysis of these products was performed using a Trio 100 mass spectrometer operating in electron impact (EI) mode, linked to a HP5890 gas chromatograph fitted with a HP-1 cross-linked methyl siloxane column (25m. i.d. 0.25mm, 0.17 mm film) under the following conditions: electron energy 70eV, source temperature 200°C, interface temperature 280°C, oven temperature 50°C increasing at 30°C per minute to 200°C, and then 10°C per minute to 300°C, injection temperture 280°C.

EXAMPLE 5 - Cis-trans co-transfection assay; demonstration of antagonism.

Chinese hamster ovary (CHO) cells were maintained and transfected in Dulbecco's modification of Eagle's medium (DMEM) supplemented with 15% foetal bovine serum, 100IU/ml penicillin, 100μg/ml streptomycin and 200mM L-glutamine (all Gibco BRL,

Paisley, UK).

24 hours prior to transfection CHO cells were plated at a density of 3 x 10^5/60 mm dish (Costar UK). Cells were transfected by the clacium phosphate method. Briefly, 5µg of MMTV-LUC and 1µg of pRShGR or 5µg of pSV2 as a control for transfection efficiency were made up to a total of 10µg/plate of DNA with pGEM3. 30µl of 2.5M $CaCl_2$ was diluted ten-fold with sterile water and 300µl was added to the DNA. Next 300µl of 2 x Hepes buffered saline (280 mM NaCl, 10mM Kcl, 1.5mM $Na_2HPO_4.2H_2$), 50mM Hepes, 12mM dextrose, pH 7.05) was added slowly with swirling to the DNA/$CaCl_2$ mixture. This solution was left for 30 minutes in order for a fine precipitate to form and 600µl was added dropwise to each plate. After 24 hours the medium was removed and the cells were washed in serum free medium and culture for a further 24 hours in medium containing 10% charcoal-stripped serum together with the appropriate concentrations of DHEA/7α-hydroxy-DHEA.

Six hours after the addition of DHEA/7α-hydroxyDHEA either B or Dex was added to each plate. The following day the cells were washed in PBS, lysed with 0.3ml of lysis buffer (25mM Tris-phosphate pH 7.8, 2mM DTT, 1% Triton X-100 and 10% glycerol), scraped, centrifuged and the supernatant assayed in duplicate in a Berthold luminometer in a total volume of 250µl, comprising 40µl of cell extract, 5µl of 30mM ATP, 100µl of assay buffer (20mM tricine, 1.07nM $(MgCO_3)_4.Mg(OH)_2.\%H_2O$, 2.67mM $MgSO_4$, 0.1mM EDTA, 33.3mM DTT, 0.2mg/ml coenzyme A) and 105µl luciferin (Promega UK) injected to initiate the reaction. Light emission was measured over 10 seconds and relative light units/microgram of protein was calculated.

Results are shown in Figure 4 wherein the fold induction of luciferase is illustrated by histogram for control, additions of DHEA, 7α-hydroxy-DHEA (7HD) alone and these additions in presence of an GR activating concentration of corticosterone. This result shows that 7HD, but not DHEA, acts as an antagonist of coticosterone effect in activating the GR-mediated transcription.

EXAMPLE 6 - Cyp7b expression in Alzheimers neurons

Cryostat brain sections (10µm) from control and Alzheimer's hippocampus were cut, thaw mounted onto gelatine-subbed poly-L-lysine coated slides and stored at -80°C.

For *in-situ* hybridization studies, brain sections were post-fixed in 4%

paraformaldehyde by acetylation (0.25% acetic anhydride in 0.1M triethanolamine, pH 8.0) for 10 minutes, rinsed in phosphate buffered saline, dehydrated through graded alcohols and air dried. Hybridization was carried out using 200µl of [^{35}S]-UTP-labelled cRNA antisense probe (10×10^6 dpm/ml in hybridization buffer) synthesized *in vitro* from a 500 bp XbaI/PstI fragment of the human Cyp7b pMMCtI clone linearised with XbaI and transcribed with T3 RNA for sense probes. Sections were prehybridized with 20µl of prehybridization buffer (as hybridization buffer but omitting the dextran sulphate) per slide at 50°C for 3 hours.

Following hybridization with probe at 50°C overnight sections were treated with RNase A (30µg/ml, 45 minutes at 37°C) and washed to a final stringency of 0.1 x SSC at 60°C. Slides were dehydrated, dipped in photographic emulsion (NTB-2, Kodak) and exposed at 4°C for 5 weeks before being developed and counterstained with 1% pyronin. The density of silver grains was assessed over individual hippocampal neurons by computer-assisted grain counting using an image analysis system (Seescan plc, Cambridge, UK), with the analysis carried out blind (sections were cut and coded by a separate individual). For each slide, one hippocampal section represents each subject. 6-10 neurons/subregion were assessed and background, counted over areas of white matter, was subtracted. Data were assessed by ANOVA followed by Scheffe post hoc test. Significance was set at $p<0.05$. Values are means ± S.E.M.

Figure 5 is a histogram showing Cyp7b expression as indicated by grain count per neuron in the dentate gyrus, CA1 and CA3 subfields of Alzheimer's disease samples as compared to the age matched control brains.

CONCLUSIONS

It can be concluded that Cyp7b, and cognate enzymes from rat, human and other mammalian species, are 7α-hydroxylases specific for steroid substrates with a 3β hydroxy group. While activities for 7-hydroxylating DHEA, pregnenolone and cholesterol have been recorded previously in a variety of crude tissue homogenates (eg. Akwa et al., Biochem. J. 288, 959-964, 1992) no characterisation of the enzyme responsible was performed previously and no activity on estradiol was recorded. Recombinant organisms expressing Cyp7b thus provide a route to the large scale manufacture of 7HP, 7HD, and 7HE, principally but not exclusively for therapeutic use or for the production of further steroid derivatives such as 7-oxo molecules.

CLAIMS

1. The use of a 7α-hydroxy or 7-oxo substituted 3β-hydroxy-steroid, or a derivative thereof substituted independently at one or both of the 7- and 3- positions with an ester or ether group, in the manufacture of a pharmaceutical composition for the therapy of neuropsychiatric, immune and/or endocrine disorders or for inducing cognitive enhancement.

2. The use according to Claim 1 wherein said disorders are selected from

(a) deficits of cognition in aging
(b) Alzheimer's disease
(c) deficits of immune system in aging
(d) deficits of immune function in HIV infection
(e) glucocorticoid or mineralocorticoid excess
(f) diabetes
(g) depression
(h) osteoporosis and hypercalcemia
(I) hyperglycemia and hyperlipodemia
(j) muscle atropy
(k) arterosclerosis
(l) steroid diabetes

3. The use as claimed in claim 1 or claim 2 wherein the steroid has a 3β-substituent-OR_1 and/or a 7α-substituent -OR_2 where -OR_1 and -OR_2 each independently represents a free hydroxy, ester or ether group,

wherein each of R_1 and R_2 are independently selected from the group consisting of hydrogen, substituted or unsubstituted C_{1-6} alkyl groups, groups R_5CO-, wherein R_5 may be selected from substituted or unsubstituted C_{1-6} alkyl groups, and groups of the formula -$OP(OH)_3$, wherein any substituents are selected from OH, halogen (F, Cl, Br, I) amino, C_{1-6} alkylamino, C_{1-6} dialkylamino, COOH or $COOR_4$ wherein R_4 represents a

C_{1-6} alkyl group;and wherein the compounds may be in free form or in the form of acid addition salts with pharmacologically acceptable anions.

4. The use as claimed in any one of claims 1 to 3 characterised in that the steroid is one possessing the carbon skeleton of cholesterol, androsterone, pregnenolone or estradiol,

5. The use of a Cyp7b steroid hydroxylase enzyme in the manufacture of a test kit for use in the diagnosis of neuropsychiatric, immune and endocrine disorders.

6. The use according to Claim 5 wherein said disorders are selected from

(a) deficits of cognition in aging
(b) Alzheimer's disease
(c) deficits of immune system in aging
(d) deficits of immune function in HIV infection
(e) glucocorticoid or mineralocorticoid excess
(f) diabetes
(g) depression
(h) osteoporosis and hypercalcemia
(i) hyperglycemia and hyperlipodemia
(j) muscle atropy
(k) arterosclerosis
(l) steroid diabetes

7. An antibody, especially a monoclonal antibody, characterised by specifically binding Cyp7b enzymes.

8. The use of an antibody as claimed in Claim 5 in a test kit for assaying for the presence of Cyp7b enzymes.

9. The use of Cyp7b coding sequences or antisense sequences in the manufacture of a targeted drug for gene therapy of Cyp deficiencies or excesses or for promoting immunogenic processes.

10. The use claimed in Claim 9 wherein a vector is co-administered with a vaccine formulation, whereby on administration, a Cyp7b sequence is expressed and the produced expression product augments an immunogenic property of the vaccine.

11. A process of producing a 7α-hydroxy-substituted steroid which comprises subjecting a corresponding steroid substrate having no substituent in the 7-position to hydroxylation in the presence of a Cyp7b steroid hydroxylase enzyme.

12. A process according to Claim 11 wherein the enzyme is a mouse, rat or human Cyp7b steroid hydroxylase enzyme.

13. A process according to Claim 11 wherein the Cyp7b steroid hydroxylase enzyme has a sequence encoded by DNA coding sequences of Cyp7b enzymes selected from

(a) Coding sequences of DNA molecules comprising the coding sequence for rat Cyp7b set forth in SEQ Id No: 1,

(b) Coding sequences of DNA molecules comprising the coding sequence for mouse Cyp7b set forth in SEQ Id No: 2,

(c) Cyp7b steroid hydroxylase-encoding DNA molecules capable of hybridizing with the DNA molecule defined in (a) or (b) under standard hybridization conditions defined as 2 x SSC at 65°C.

(d) Cyp7b steroid hydroxylase-encoding DNA molecules capable of hybridizing with the DNA molecule defined in (a), (b) or (c) under reduced stringency hybridization conditions defined as 6 x SSC at 55°C.

14. A process according to Claim 11 wherein the Cyp7b steroid hydroxylase enzyme has a sequence encoded by DNA coding sequences of Cyp7b enzymes selected from

(e) DNA coding sequences selected from the following:

(i) the sequence designated "exon 3" in SEQ Id No 3.

(ii) the sequence designated "exon 4" in SEQ Id No 3. and

(f) Cyp7b steroid hydroxylase-encoding DNA molecules capable of hybridizing with the DNA molecules defined in (e) under standard hybridization conditions defined as 2 x SSC at 65°C.

(g) Cyp7b steroid hydroxylase encoding DNA molecules capable of hybridizing with the DNA molecule defined in (e) or (f) under reduced stringency hybridization conditions defined as 6 x SSC at 55°C.

(h) Cyp7b steroid hydroxylase-encoding DNA molecules comprising contiguous pairs of sequences selected from

(i) the sequence designated "exon 3" in SEQ Id No 3,

(ii) the sequence designated "exon 4" in SEQ Id No 3, and

(i) Cyp7b steroid hydroxylase-encoding DNA molecules capable of hybridizing with the DNA molecules defined in (h) under standard hybridization conditions defined as 2 x SSC at 65°C.

(j) Cyp7b steroid hydroxylase-encoding DNA molecules capable of hybridizing with the DNA molecule defined in (h) or (i) under reduced stringency hybridization conditions defined as 6 x SSC at 55°C.

(k) Coding sequences of DNA molecules comprising a contiguous coding sequence consisting of the sequences "exon 3" and "exon 4" in SEQ Id No 3, and

(l) Cyp7b steroid hydroxylase-encoding DNA molecules capable of hybridizing with the DNA molecules defined in (k) under standard hybridization conditions defined as 2 x SSC at 65°C.

(m) Cyp7b steroid hydroxylase-encoding DNA molecules capable of hybridizing with the DNA molecule defined in (k) or (l) under reduced stringency hybridization conditions defined as 6 x SSC at 55°C.

15. A process according to Claim 11 wherein the Cyp7b steroid hydroxylase enzyme has a sequence encoded by DNA coding sequences of Cyp7b enzymes selected from the amino acid sequences contained in SEQ ID NO. 4, SEQ ID NO. 5 or SEQ ID NO 6 or a sequence which has at least 50% homology with one or more of the aforementioned sequences, provided that the capacity to catalyse the introduction of a 7α-hydroxyl group is not eliminated.

16. A process according to Claim 15 wherein the Cyp7b steroid hydroxylase enzyme has a sequence encoded by a DNA coding sequence which has at least 60% homology, and preferably at least 70% homology with one or more of the aforementioned sequences, provided that the capacity to catalyse the introduction of a 7α-hydroxyl group is not eliminated.

17. A process according to Claim 15 wherein the Cyp7b steroid hydroxylase enzyme has a sequence which differs from the amino acid sequences contained in SEQ ID NO. 4, SEQ ID NO. 5 or SEQ ID NO 6 by not more than 20, preferably not more than 10 and most preferably not more than 5 amino acid substitutions, insertions or deletions.

18. A process according to any preceding claim wherein substrate is a steroid possessing a 3β-hydroxyl group.

19. A process according to any preceding claim wherein the substrate is a steroid possessing the carbon skeleton of cholesterol, androsterone, pregnenolone or estradiol, with

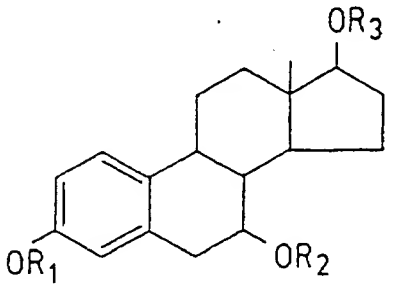
the proviso that where the substrate has the carbon skeleton of cholesterol, the substrate has a hydroxyl group in the 25, 26 or 27-position.

20. A process according to Claim 19 wherein the substrate is 25-hydroxycholesterol, dehydroepiandrosterone, pregnenolone or estradiol.

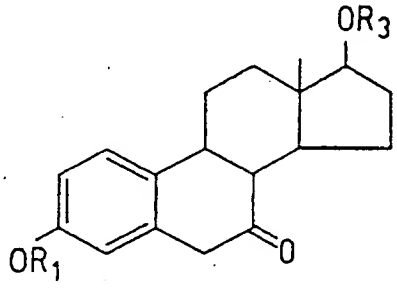
21. A process according to any preceding claim wherein the produced 7α-hydroxy-substituted steroid is 7α-hydroxyestradiol, 7α-hydroxypregnenolone or 7α-hydroxydehydroepiandrosterone.

22. A process according to any preceding claim wherein produced steroid is subjected to an oxidation step to convert an H,OH to an oxo group.

23. A steroid of the formula



Ia



Ib

wherein OR_1, OR_2 and OR_3 each independently represents a free hydroxy group, an ether group or an esterified hydroxy group.

24. A steroid according to Claim 23 wherein

each of R_1, R_2 and R_3 may be selected from substituted or unsubstituted C_{1-6} alkyl groups, any such substituents being selected from OH, halogen (F, Cl, Br, I) amino, (C_{1-6}) alkylamino, C_{1-6} dialkylamino, COOH or $COOR_4$ wherein R_4 represents a C_{1-6} alkyl group which may be unsubstituted or substituted by one of the substituents referred to above; or

OR_1, OR_2 and OR_3 each independently represents an esterified hydroxy group, of the formula R_5COO-, wherein R_5 may be selected from substituted or unsubstituted C_{1-6} alkyl groups, any such substituents being selected from OH, halogen (F, Cl, Br, I) amino, C_{1-6} alkylamino, C_{1-6} dialkylamino, COOH or $COOR_4$ wherein R_4 represents a C_{1-6} alkyl group;

or

OR_1, OR_2 and OR_3 each independently represents an esterified hydroxy group of formula $-OP(OH)_3$,

or a pharmacologically acceptable salt of such a compound.

25. 7α-Hydroxyestradiol or 7-oxoestradiol.

26. A steroid as claimed in Claim 23 characterised in that it is a 3β-hydroxy steroid.

27. A process of producing an oxo-substituted steroid which comprises subjecting 7α-hydroxyestradiol, 7α-hydroxypregnenolone or 7α-hydroxydehydroepiandrosterone to oxidation.

28. A method for treating a human or animal requiring therapy for a neuropsychiatric, immune and endocrine disorder or for inducing cognitive enhancement comprising the adminsitration of an effective amount of a 7α-hydroxy or 7-oxo substituted 3β-hydroxy-steroid or derivative thereof independently substituted at one or both of the 7-and 3-positions by an ester or ether group.

29. A method according to Claim 28 wherein said disorders are selected from

(a) deficits of cognition in aging
(b) Alzheimer's disease
(c) deficits of immune system in aging
(d) deficits of immune function in HIV infection
(e) glucocorticoid or mineralocorticoid excess
(f) diabetes
(g) depression

(h) osteoporosis and hypercalcemia

(I) hyperglycemia and hyperlipodemia

(j) muscle atropy

(k) arteroscierosis

(l) steroid diabetes

30. A method as claimed in claim 28 wherein the steroid possesses the carbon skeleton of cholesterol, androsterone, pregnenolone or estradiol and has a 3β-substituent-OR_1 and/or a 7α-substituent -OR_2 where -OR_1 and -OR_2 each independently represents a free hydroxy, ester or ether group,

wherein each of R_1 and R_2 are independently selected from the group consisting of hydrogen, substituted or unsubstituted C_{1-6} alkyl groups, groups R_5CO-, wherein R_5 may be selected from substituted or unsubstituted C_{1-6} alkyl groups, and groups of the formula -$OP(OH)_3$, wherein any substituents are selected from OH, halogen (F, Cl, Br, I) amino, C_{1-6} alkylamino, C_{1-6} dialkylamino, COOH or $COOR_4$ wherein R_4 represents a C_{1-6} alkyl group;and wherein the compounds may be in free form or in the form of acid addition salts with pharmacologically acceptable anions.

31. A 7α-hydroxy or 7-oxo substituted 3β-hydroxy-steroid possessing the carbon skeleton of cholesterol, androsterone, pregnenolone or estradiol, or a derivative thereof substituted indcpendently at one or both of the 7- and 3- positions with an ester or ether group for use in therapy.

32. A steroid as claimed in claim 31 selected from 7α-hydroxydehydroepiandrosterone, 7α-hydroxypregnenolone and 7α-hydroxyestradiol.

33. A pharmaceutical composition characterised in that it comprises a 7α-hydroxy or 7-oxo substituted 3β-hydroxy steroid possessing the carbon skeleton of cholesterol, androsterone, pregnenolone or estradiol, or a derivative thereof substituted independently at one or both of the 7- and 3- positions with an ester or ether group, in association with a pharmaceutically acceptable carrier or diluent in a sterile and pyrogen free form.

(74) Agent: DOLAN, Anthony, Patrick; British Technology Group Ltd., Patents Dept., 101 Newington Causeway, London SE1 6BU (GB).

(81) Designated States: AL, AM, AT, AU, AZ, BA, BB, BG, BR, BY, CA, CH, CN, CU, CZ, DE, DK, EE, ES, FI, GB, GE, HU, IL, IS, JP, KE, KG, KP, KR, KZ, LC, LK, LR, LS, LT, LU, LV, MD, MG, MK, MN, MW, MX, NO, NZ, PL, PT, RO, RU, SD, SE, SG, SI, SK, TJ, TM, TR, TT, UA, UG, US, UZ, VN, ARIPO patent (GH, KE, LS, MW, SD, SZ, UG), Eurasian patent (AM, AZ, BY, KG, KZ, MD, RU, TJ, TM), European patent (AT, BE, CH, DE, DK, ES, FI, FR, GB, GR, IE, IT, LU, MC, NL, PT, SE), OAPI patent (BF, BJ, CF, CG, CI, CM, GA, GN, ML, MR, NE, SN, TD, TG).

Published

With international search report.

Before the expiration of the time limit for amending the claims and to be republished in the event of the receipt of amendments.

(88) Date of publication of the international search report: 4 December 1997 (04.12.97)

(54) Title: USE OF 7 ALPHA-SUBSTITUTED STEROIDS TO TREAT NEUROPSYCHIATRIC, IMMUNE OR ENDOCRINE DISORDERS

(57) Abstract

Use is provided for a 7α-hydroxy or 7-oxo substituted 3β-hydroxy-steroid possessing the carbon skeleton of cholesterol, androsterone, pregnenolone or estradiol, or an analogue thereof substituted independently at one or both of the 7- and 3-positions with an ester or ether group, in the manufacture of a pharmaceutical composition for the therapy of neuropsychiatric, immune and/or endocrine disorders or for inducing cognitive enhancement. Uses for Cyp7b enzymes in producing such steroids is also provided together with various novel steroids and test kits and methods for diagnosing the disorders.

INTERNATIONAL SEARCH REPORT

Int -nal Application No
PCT/GB 97/00955

A. CLASSIFICATION OF SUBJECT MATTER
IPC 6 A61K31/565 C07J1/00 C12P33/00 A61K39/395

According to International Patent Classification (IPC) or to both national classdication and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
IPC 6 A61K C07J C12P

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	WO 94 03176 A (HUMANETICS CORP.) 17 February 1994 see claims; examples ---	1-4, 28-33
P,X	WO 96 12810 A (UNIVERSITY OF EDINBURGH) 2 May 1996 cited in the application see claim 20 ---	7
P,X	K.A. ROSE ET AL.: "Cyp7b, anovel brain cytochrome P450, catalyzes the synthesis of neurosteroids 7alpha-hydroxy dehydroepiandrosterone and 7 alpha-hydroxy pregnenolone." BIOCHEMISTRY, vol. 94, no. 10, 1997, pages 4925-4930, XP002042014 see the whole document --- -/--	11,12, 18-21

[X] Further documents are listed in the continuation of box C.

[X] Patent family members are listed in annex.

* Special categories of cited documents :

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&" document member of the same patent family

INTERNATIONAL SEARCH REPORT

International application No.
PCT/GB 97/00955

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. [ ] Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. [X] Claims Nos.: 1, 28
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
It is not clear which compounds are described by "..or a derivative thereof .." nor is it clear which diseases are meant by descriptions like "...neuro psychiatric, immune and/or endocrine disorders..". The search has therefor been limited to the examples mentioned in the claims and/or description.

3. [ ] Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

See annex

1. [X] As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. [ ] As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. [ ] As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. [ ] No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

[X] The additional search fees were accompanied by the applicant's protest.

[ ] No protest accompanied the payment of additional search fees.

INTERNATIONAL SEARCH REPORT

International Application No. PCT/GB 97 00955

FURTHER INFORMATION CONTINUED FROM PCT/ISA/210
